viroc

cement-bonded particle boards

Viroc is a natural cement particle board used to create a rustic and authentic appearance for external facades, walls, ceilings, floors and interior design.

Thanks to its composition of compressed and dry mix pine wood particles and cement, Viroc boards are highly durable but easily fabricated.

Viroc panels appeal to architectural needs thanks to their natural appearance which can be further enhanced by three different finishes: raw (unpolished), polished and sanded. The sanded finish shows visible wood particles on the surface of the board. This cement board can be cut, drilled and sanded like wood and offers easy installation.

Sizes*
